GDPR - How Anti-Malware Software Will Help

Being a victim of computer malware could cripple your organisation. You may also be at risk of allowing malicious software access to data belonging to you and your clients. With the imminent implementations of GDPR, you need adequate protection in place.

We used to just talk about computer viruses, but there is now so much more malicious software. It is in the form of viruses, spyware, adware, Trojans and worms. It is designed to disrupt your computers, steal data, log keystrokes or encrypt data for ransom.

Protecting data is the central tenet of the GDPR legislation, so defending it from malicious threats is vital. Utilising reliable anti-malware software across your network will help safeguard your systems and data.

Good malware security provides advanced defences that prevent, contain and take action against threats and sophisticated attacks. It will offer robust protection for your PCs and also offer:

- Anti-virus defence for your servers
- Firewall protection for PCs and laptops - particularly important for computers that are used away from your office
- Web filtering
- Managed encryption - also important for computers used away from the office

Vantage IT can configure, manage and update anti-virus software used at your premises and by your remote users. For support with your GDPR IT requirements, please call Vantage IT on 01296 668966 or email enquiries@vantageit.co.uk.
